

SOP ENG-007: Preventive Maintenance of Tablet Compression Machines

SOP Number: ENG-007. Scope: All tablet compression machines (TCM-01 through TCM-06) at the Meridian Pharmaceuticals manufacturing facility.

Requirement: Every compression machine must undergo a full preventive maintenance checkup, including punch and die inspection, every 90 days. Punches showing wear beyond tolerance must be replaced before the machine is returned to production.

Responsible Party: Maintenance Team, under supervision of Maintenance Engineer Anita Desai. Maintenance Technician Suresh Iyer is responsible for logging checkup completion in the Machine Maintenance Log.

Non-compliance with this SOP has historically been linked to tablet weight and hardness deviations due to degraded punch tooling.
